         Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Score

```

The present invention is concerned with methods of using C. elegans identify compounds which are capable of up- and down-regulating the activity of the sarco/endoplasmic reticulum calcium ATPase (SERCA). protein is involved in cell signalling, and elevated levels affect cellular processes such as contraction, secretion and cell cycling.

Claim 44; SEQ ID

NO 3624; 874pp; English

The invention relates to a method of phospholamban polymorphism assessment in an individual which comprises comparing the analysis nucleotide fragment with a predetermined phospholamban nucleotide fragment sequence to determine whether the individual carries a phospholamban polymorphism. The methods and phospholamban polymorphism.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention describes a method for determining whether a compound induces a toxic effect on a tissue or cell. The method comprise preparing a gene expression profile of a tissue or cell sample exposed the compound, and comparing the gene expression profile to a database comprising data or information on the Tox mean and non-Tox mean value. The method is useful for predicting or identifying at least one toxic effect, particularly hepatotoxicity, of a test or unknown compound. The genes listed in the specification are useful as diagnostic or toxicity markers for the prediction or identification of the physiological state of tissue or cell sample that has been exposed to a compound, or to identify or predict the toxic effects of a compound or an agent. These identify or predict the toxic effects of a compound or an agent. These
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           may also be used as markers for monitoring toxicity progression or for drug screening. The present sequence represents a primary rat hepatocyte toxicity modelling related gene sequence from the present invention.
                                                                                                                                             Phospholamban polymorphism assessment in individual, for determining for developing cardiovascular disease, by comparing analysis of the nucleotide fragment with a predetermined phospholamban nucleotide

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Score

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

```

The present invention is concerned with methods of using C. elegans identify compounds which are capable of up- and down-regulating the activity of the sacro/endoplasmic reticulum calcium ATPase (SERCA). protein is involved in cell signalling, and elevated levels affect cellular processes such as contraction, secretion and cell cycling.

This The

ö

Identifying modulators of sarco/endoplasmic reticulum calcium ATPase, useful potentially for treating disorders of calcium homeostasis, e.g. cardiac hypertrophy.

NO 3624; 874pp; English

The invention relates to a method of phospholamban polymorphism assessment in an individual which comprises comparing the analysis nucleotide fragment with a predetermined phospholamban nucleotide fragment sequence to determine whether the individual carries a phospholamban polymorphism. The methods and phospholamban polymorphism of the individual carries a phospholamban polymorphism. The methods and phospholamban polymorphism of the individual is at risk for fragment are useful for determining if an individual is at risk for

phospholamban polymorphism ndividual is at risk for

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        effect, particularly hepatotoxicity, or a continuous genes listed in the specification are useful as diagnostic or toxicity markers for the prediction or identification of the physiological state of tissue or cell sample that has been exposed to a compound, or to identify or predict the toxic effects of a compound or an agent. These may also be used as markers for monitoring toxicity progression or for drug screening. The present sequence represents a primary rat hepatocytoxicity modelling related gene sequence from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention describes a method for determining whether a compound induces a toxic effect on a tissue or cell. The method comprises preparing a gene expression profile of a tissue or cell sample exposed to the compound, and comparing the gene expression profile to a database comprising data or information on the Tox mean and non-Tox mean value. The method is useful for predicting or identifying at least one toxic effect, particularly hepatotoxicity, of a test or unknown compound. The
                                                                                                                                          Phospholamban polymorphism assessment in individual, for determining for developing cardiovascular disease, by comparing analysis of the nucleotide fragment with a predetermined phospholamban nucleotide
                                                                                                                                                                                                                                                                                                                                                                                                US2004191802-A1

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                           Score

```

The present invention is concerned with methods of using C. elegans identify compounds which are capable of up- and down-regulating the activity of the sacro/endoplasmic reticulum calcium ATPase (SERCA). protein is involved in cell signalling, and elevated levels affect cellular processes such as contraction, secretion and cell cycling.

This The

ç

Identifying modulators of sarco/endoplasmic reticulum calcium ATPouseful potentially for treating disorders of calcium homeostasis, cardiac hypertrophy.

$99999999999999
                                                                                                       The present invention describes a method for determining whether a compound induces a toxic effect on a tissue or cell. The method comprises preparing a gene expression profile of a tissue or cell sample exposed to the compound, and comparing the gene expression profile to a database comprising data or information on the Tox mean and non-Tox mean value. The method is useful for predicting or identifying at least one toxic effect, particularly hepatotoxicity, of a test or unknown compound. The genes listed in the specification are useful as diagnostic or toxicity markers for the prediction or identification of the physiological state of tissue or cell sample that has been exposed to a compound, or to identify or predict the toxic effects of a compound or an agent. These may also be used as markers for monitoring toxicity progression or for
Sequence
                                                        drug screening. The present sequence represents a primary rat hepatocyte toxicity modelling related gene sequence from the present invention.

```

The invention relates to a method of phospholamban polymorphism assessment in an individual which comprises comparing the analysis nucleotide fragment with a predetermined phospholamban nucleotide fragment sequence to determine whether the individual carries a phospholamban polymorphism. The methods and phospholamban polymorph fragment are useful for determining if an individual is at risk for Phospholamban polymorphism assessment in individual, for determining for developing cardiovascular disease, by comparing analysis of the nucleotide fragment with a predetermined phospholamban nucleotide Claim 15; SEQ ID NO 1; 15pp; English riek the

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Score
